RESTAURANT ORDER MANAGEMENT SYSTEM

**The domain of the Project: Salesforce Cloud Computing / CRM /
Application Development**

COURSE NAME: G2 Salesforce

**Team Mentors (and their designation):
Shriram sir**

Team Members:

Md. Sajid salim

Period of the project

April 2026 to September 2026

Innovation & Entrepreneurship Hub for Educated Rural Youth (SURE Trust – IERY)

Declaration

The project titled “**Restaurant Order Management System**” has been completed as part of the project-based learning initiative organized by **SURE Trust – Innovation & Entrepreneurship Hub for Educated Rural Youth (IERY)**.

The project focuses on developing a Salesforce-based restaurant management application that can be used to manage restaurants, customers, menu items, orders, tables, payments, deliveries, and chefs. The system incorporates Salesforce objects, relationships, validation rules, record types, automation using Flows, Apex programming, Lightning Web Components (LWC), reports, dashboards, and security configurations.

The project provided practical exposure to Salesforce development and helped in understanding how cloud-based CRM platforms can be used to build industry-relevant business applications.

I declare that the work carried out in this project has enhanced my practical knowledge and understanding of Salesforce development, automation, database design, application development, and business process management.

5. Social / Industry relevance of the project
6. Learning & Reflection
7. Future Scope & Conclusion

1 Executive Summary

The **Restaurant Order Management System** is a Salesforce-based application designed to digitally manage important restaurant operations through a centralized cloud platform.

Traditional restaurant management can involve separate processes for managing customers, menu items, orders, payments, tables, chefs, and deliveries. Managing these activities manually can result in data duplication, difficulty in tracking orders, errors in payment records, and limited visibility into restaurant performance.

The objective of this project was to develop an integrated restaurant management solution using Salesforce. The system uses standard Salesforce objects such as **Account** and **Contact**, along with custom objects including **Menu Item, Order, Table, Payment, Delivery, and Chef**.

The application supports the complete order management process. Customers can be associated with orders, menu items can be maintained with their availability and pricing information, orders can be created and tracked, payments can be recorded, and deliveries can be monitored.

Salesforce **Validation Rules** were implemented to maintain data accuracy. For example, menu item prices and payment amounts cannot be zero or negative, order dates cannot be future dates, delivery dates cannot occur before order dates, and table numbers are unique. Duplicate active orders for the same table are also prevented.

The project uses **Salesforce Flow** for process automation. Screen Flows were developed for creating customer orders and processing payments. Record-triggered Flows automatically update order and payment statuses. Scheduled Flows support daily order summaries, delayed delivery notifications, and daily sales reporting.

Apex programming was used for business logic that required programmatic processing. The project includes an Apex trigger for preventing duplicate active orders, Batch Apex for daily restaurant sales processing, and Schedulable Apex for order confirmation and delivery reminder notifications.

The project also includes **Lightning Web Components (LWC)** for interactive user interfaces such as Restaurant Dashboard, Order Management, Payment, and Delivery management.

Finally, Salesforce Reports and Dashboards provide management-level visibility into orders, customers, revenue, payments, deliveries, pending orders, and menu item information.

Overall, the project demonstrates how Salesforce can be used to develop a scalable cloud-based restaurant management solution while combining declarative configuration with programmatic development.

2 Introduction

2.1 Background and Context

The restaurant industry handles a large amount of information every day. Restaurant staff need to manage customers, restaurants, menu items, tables, orders, payments, chefs, and deliveries.

When these activities are managed manually or through disconnected systems, it can become difficult to maintain accurate records and monitor the current status of restaurant operations.

Cloud-based systems provide a centralized environment where business data can be stored, processed, automated, and analyzed.

Salesforce is a cloud-based CRM platform that provides both declarative and programmatic development capabilities. Its features such as custom objects, relationships, validation rules, Flow, Apex, Lightning Web Components, Reports, Dashboards, and security controls make it suitable for developing business applications.

The **Restaurant Order Management System** was therefore developed as a Salesforce application to demonstrate how these capabilities can be combined to solve a practical business problem.

Innovation & Entrepreneurship Hub for Educated Rural Youth (SURE Trust – IERY)

2.2 Problem Statement

A restaurant requires an efficient system to manage its day-to-day operations.

The major problems addressed by this project include:

- Maintaining customer information.
- Managing restaurant information.
- Maintaining menu item details and prices.
- Tracking table availability.
- Creating and tracking customer orders.
- Managing payment information.
- Monitoring delivery status.
- Maintaining chef information.
- Preventing invalid data.
- Preventing duplicate active orders for the same table.
- Automating repetitive business processes.
- Providing management reports and dashboards.

The project aims to provide a centralized Salesforce-based solution for these requirements.

2.3 Scope of the Project

The system covers the following major areas:

Restaurant Management

Salesforce **Account** is used to represent restaurant information.

Customer Management

Salesforce **Contact** is used to maintain customer information.

Innovation & Entrepreneurship Hub for Educated Rural Youth (SURE Trust – IERY)

Menu Management

The custom **Menu Item** object maintains:

- Menu Item Name
- Category
- Price
- Availability Status
- Restaurant
- Chef

Menu categories include:

- Starters
- Main Course
- Desserts
- Beverages

Order Management

The custom **Order** object manages:

- Order Number
- Customer
- Order Date
- Order Type
- Order Status
- Total Amount
- Table

Order types include:

- Dine-In
- Takeaway
- Online

Order statuses include:

- Placed
- Preparing
- Ready
- Delivered
- Cancelled

Table Management

The **Table** object maintains:

Innovation & Entrepreneurship Hub for Educated Rural Youth (SURE Trust – IERY)

- Table Number
- Seating Capacity
- Table Status

Table statuses include:

- Available
- Occupied
- Reserved

Payment Management

The **Payment** object manages:

- Order
- Payment Date
- Payment Method
- Amount
- Payment Status

Payment methods include:

- Cash
- Card
- UPI

Delivery Management

The **Delivery** object manages:

- Restaurant Order
- Delivery Partner
- Delivery Date
- Delivery Status

Chef Management

The **Chef** object maintains:

- Chef Name
- Employee ID
- Phone
- Specialty

Chef specialties include:

- South Indian

Innovation & Entrepreneurship Hub for Educated Rural Youth (SURE Trust – IERY)

- North Indian
- Chinese
- Continental

2.4 Limitations

The implemented system focuses on the requirements defined for the project.

One limitation is that the current Order object stores the overall order amount but does not include a separate **Order Item/Order Line** object for maintaining individual menu items and quantities within each order.

Therefore, the current system does not implement a complete shopping-cart-style process where multiple menu items and quantities are selected while placing an order.

This was intentionally kept outside the implemented scope because it was not part of the specified project data model.

2.5 Innovation Component

The project combines Salesforce's declarative and programmatic capabilities to create an integrated restaurant management application.

The innovative aspects include:

- Automated order status management using Flow.
- Automated payment status updates.
- Automated delivery status synchronization.
- Duplicate active order prevention.
- Scheduled order confirmation emails.
- Scheduled delivery reminder notifications.
- Daily sales processing using Batch Apex.
- Interactive Lightning Web Components.
- Management dashboards for quick decision-making.

Innovation & Entrepreneurship Hub for Educated Rural Youth (SURE Trust – IERY)

- Role-based access and private sharing settings.

The combination of these features demonstrates how a cloud CRM platform can be customized for a specific business domain.

3 Project Objectives

The main objective of the project is to develop a **Salesforce-based Restaurant Order Management System** that provides centralized management and automation of restaurant operations.

The major objectives are:

3.1 Customer Management

To maintain customer information using Salesforce Contacts and associate customers with their restaurant orders.

3.2 Restaurant Management

To use Salesforce Accounts for maintaining restaurant information and associating menu items with restaurants.

3.3 Menu Management

To maintain menu items along with their categories, prices, availability status, restaurant, and chef.

3.4 Order Management

Innovation & Entrepreneurship Hub for Educated Rural Youth (SURE Trust – IERY)

To create and track restaurant orders with information such as customer, table, order type, date, status, and total amount.

3.5 Table Management

To maintain restaurant tables and track their seating capacity and availability status.

3.6 Payment Management

To record payments associated with orders and track payment method, amount, date, and payment status.

3.7 Delivery Management

To assign delivery partners and track delivery status.

3.8 Data Validation

To ensure that incorrect or invalid data cannot be entered into the system.

3.9 Process Automation

To reduce manual work by implementing Salesforce Flows for common business processes.

3.10 Programmatic Processing

To use Apex for business requirements such as duplicate-order prevention, batch sales processing, and scheduled notifications.

3.11 User Interface Development

To create interactive Lightning Web Components for restaurant operations.

3.12 Reporting and Analytics

To provide reports and dashboards that help management monitor restaurant performance.

Expected Outcomes

The expected outcomes of the project include:

- A functional Salesforce restaurant management application.
- Centralized restaurant and customer data.
- Automated order and payment processing.
- Automated delivery tracking.
- Data validation and duplicate prevention.
- Interactive LWC-based interfaces.
- Automated email notifications.
- Reports for restaurant operations.
- A management dashboard for key performance indicators.

Innovation & Entrepreneurship Hub for Educated Rural Youth (SURE Trust – IERY)

4. Methodology and Results

The project was developed using Salesforce Developer Edition and followed a structured development approach.

The methodology consisted of:

1. Requirement analysis
2. Data model design
3. Object and field creation
4. Relationship configuration
5. Validation implementation
6. Record Type configuration
7. Flow automation
8. Apex development
9. Lightning Web Component development
10. Reports and Dashboard creation
11. Security configuration
12. Testing and validation

4.1 Technologies Used

The major technologies and Salesforce features used were:

- Salesforce Platform
- Salesforce Lightning Experience
- Custom Objects
- Standard Objects
- Lookup Relationships
- Picklist Fields
- Currency Fields
- Date Fields
- Validation Rules
- Record Types

Innovation & Entrepreneurship Hub for Educated Rural Youth (SURE Trust – IERY)

- Salesforce Flow
- Apex
- Apex Trigger
- Batch Apex
- Schedulable Apex
- Lightning Web Components
- Salesforce Reports
- Salesforce Dashboards
- Salesforce Security and Sharing

4.2 Salesforce Data Model

The application uses both standard and custom Salesforce objects.

Standard Objects

Account → Restaurant

The Account object represents the restaurant.

Contact → Customer

The Contact object represents customers.

Custom Objects

- Menu Item

The screenshot displays the Salesforce 'New Menu Item' form. The form is titled 'New Menu Item' and contains the following fields:

- Menu Item Name:** A required text field containing the value '1'.
- Category:** A dropdown menu with 'None' selected.
- Price:** A text input field.
- Availability Status:** A dropdown menu with 'None' selected.
- Restaurant:** A search input field with the placeholder 'Search Accounts...'.
- Chef:** A search input field with the placeholder 'Search Chefs...'.

The form also shows the user 'Sajid salim' as the owner. At the bottom, there are 'Cancel', 'Save & New', and 'Save' buttons. The background shows the Salesforce interface with a 'Recently Viewed' list and a 'Menu Items' table.

Innovation & Entrepreneurship Hub for Educated Rural Youth (SURE Trust – IERY)

- Order
- Table
- Payment
- Delivery
- Chef

Relationships

The major relationships implemented are:

Account → Menu Item

One restaurant can have multiple menu items.

Contact → Order

One customer can have multiple orders.

Order → Payment

An order can have payment records.

Order → Delivery

An order can have delivery information.

Table → Order

A table can be associated with multiple orders over time.

Chef → Menu Item

A chef can be associated with multiple menu items.

Validation rules were implemented to maintain data integrity.

The system prevents a menu item from being saved when the price is zero or negative.

Price must be greater than 0.

Payment amounts must be greater than zero.

Payment amount must be greater than 0.

The Order Date cannot be a future date.

Order Date cannot be a future date.

Delivery Date Validation

Innovation & Entrepreneurship Hub for Educated Rural Youth (SURE Trust – IERY)

The Delivery Date cannot be earlier than the associated Order Date.

Error Message:

Delivery Date cannot be earlier than Order Date.

Table Number Uniqueness

Table numbers are configured as unique so that the same table number cannot be entered for multiple table records.

Duplicate Active Order Prevention

The system prevents another active order from being created for a table when an existing order for that table has a status of:

- Placed
- Preparing
- Ready

This ensures that active tables are not assigned conflicting orders.

The screenshot displays the Salesforce Order Management interface. At the top, a navigation bar includes links for Sales, Home, Delivery, Payment, Order Management, Restaurant Dashboard, and Opportunities. A search bar is located in the center of the navigation bar. Below the navigation bar, a red error message box states "Error: Unable to place order." The main content area is titled "Order Management" and contains a "Place Order" form. The form includes the following fields: Customer (Jack Rogers), Order Date (06-Sept-2026), Order Type (Dine-in), Table (Table number 4), and Total Amount (898). A "Place Order" button is located at the bottom of the form. Below the form, there is a "View Order Status" section with a table that has columns for Order Number, Customer, Order Date, Order Type, Status, and Total Amount. The table is currently empty. The bottom of the screenshot shows the Windows taskbar with various application icons and the system clock displaying 12:46 AM on 07-09-2026.

4.4 Record Types

Record Types were configured to support different business scenarios.

Order Record Types

- Dine-In
- Takeaway

Innovation & Entrepreneurship Hub for Educated Rural Youth (SURE Trust – IERY)

- Online

Payment Record Types

- Cash Payment
- Digital Payment

These Record Types help organize different types of restaurant transactions.

4.5 Salesforce Flows

Salesforce Flow was extensively used for automation.

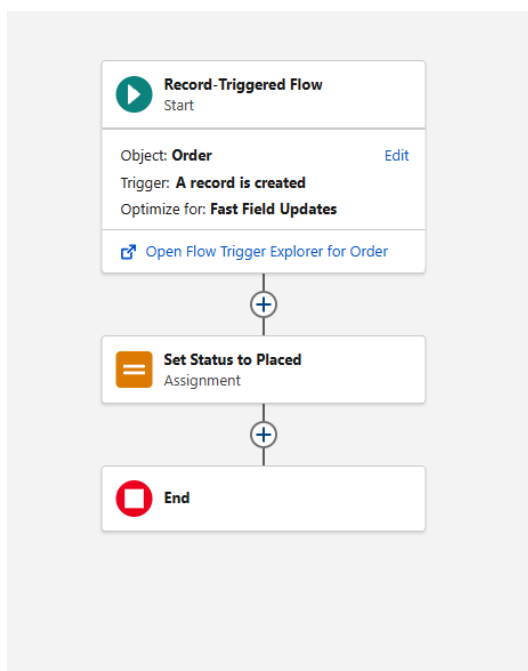

Screen Flow – Create Customer Order

A Screen Flow was created to allow users to create customer orders.

The screen collects information such as:

- Customer
- Order Date
- Order Type
- Total Amount
- Table

After the user submits the information, an Order record is created.

Innovation & Entrepreneurship Hub for Educated Rural Youth (SURE Trust – IERY)

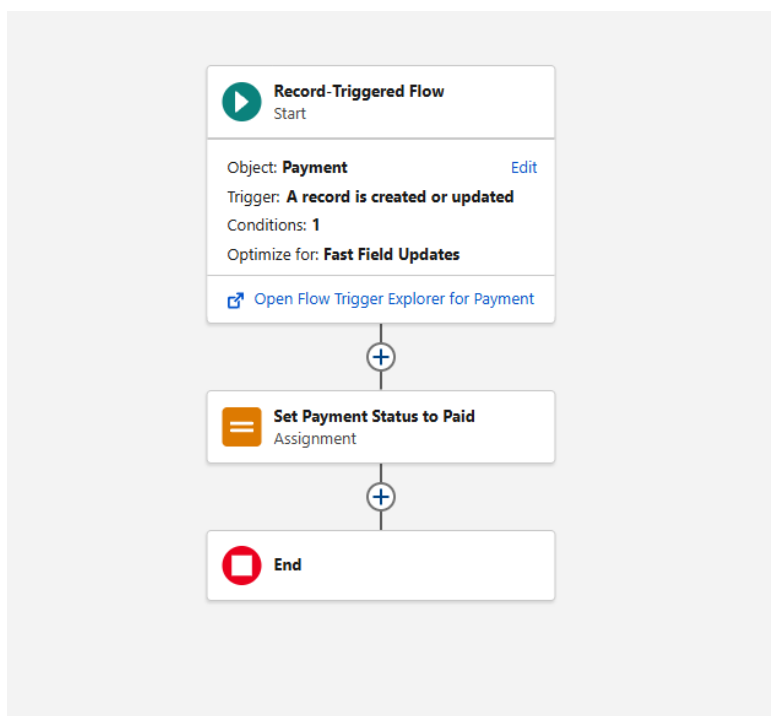

Screen Flow – Process Payment

A separate Screen Flow was created for processing payments.

The user provides:

- Restaurant Order
- Payment Date
- Payment Method
- Amount

After successful creation, the system displays a payment-success message.

Record-Triggered Flow – Order Created

When an Order is created, the record-triggered Flow automatically sets its status to:

Placed

This reduces the need for manual status entry.

Record-Triggered Flow – Payment Completed

When a payment has a valid payment date, the system automatically sets the Payment Status to:

Paid

Innovation & Entrepreneurship Hub for Educated Rural Youth (SURE Trust – IERY)

Record-Triggered Flow – Order Delivered

When the Delivery Status changes to:

Delivered

the related Order Status is automatically updated to:

Delivered

This keeps order and delivery information synchronized.

Scheduled Flow – Daily Order Summary

A scheduled Flow retrieves orders for the current day and sends a daily order summary email.

This provides management with regular information about the day's orders.

Scheduled Flow – Delayed Delivery Notifications

The system checks for deliveries where:

- Delivery Date is earlier than the current date.
- Delivery Status is not Delivered.

For such deliveries, notification emails can be sent to customers.

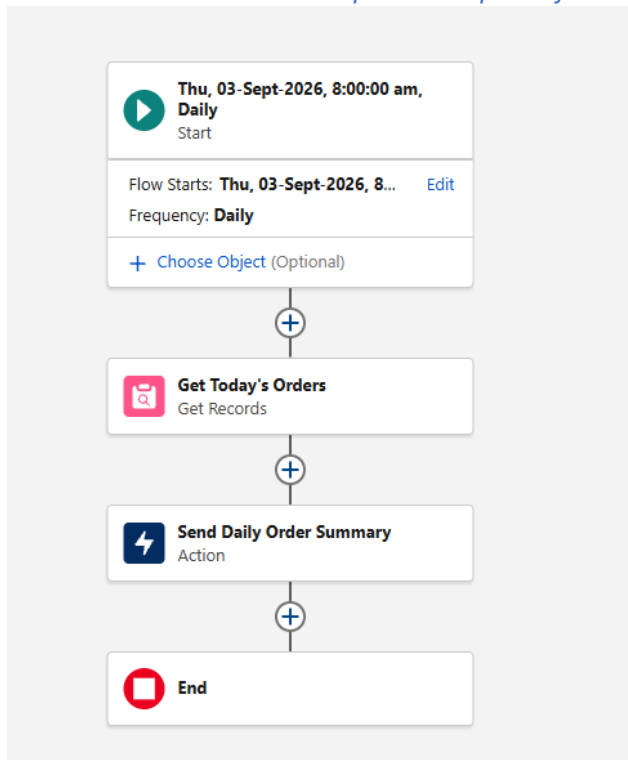

Scheduled Flow – Daily Sales Report

The system retrieves the day's orders, calculates the daily revenue, and sends a sales report to the Restaurant Manager.

This reduces manual calculation and reporting work.

Innovation & Entrepreneurship Hub for Educated Rural Youth (SURE Trust – IERY)

4.6 Apex Development

Apex was used where programmatic logic was appropriate.

Apex Trigger – Duplicate Active Order Prevention

An Apex trigger was implemented on the Order object.

The trigger checks whether an active order already exists for the selected table.

Active statuses are:

- Placed
- Preparing
- Ready

If another active order exists, the new order is rejected with an error message.

Error:

An active order already exists for this table.

This provides an additional programmatic mechanism for enforcing the business rule.

Innovation & Entrepreneurship Hub for Educated Rural Youth (SURE Trust – IERY)

Batch Apex – Daily Restaurant Sales

A Batch Apex class named **DailyRestaurantSalesBatch** was implemented.

The batch process retrieves orders for the current day and calculates the total restaurant sales.

The processing logic:

Innovation & Entrepreneurship Hub for Educated Rural Youth (SURE Trust – IERY)

1. Retrieve today's orders.
2. Read the Total Amount of each order.
3. Add the amounts together.
4. Display the calculated daily sales.
5. Complete the batch process.

The Batch Apex was tested successfully with order data.

Schedulable Apex – Daily Order Confirmation

The **DailyOrderConfirmationScheduler** class retrieves today's orders and sends order confirmation emails to customers who have an email address.

The email includes:

- Order confirmation
- Order number
- Thank-you message

The scheduler was configured to run daily.

Schedulable Apex – Delivery Reminder

The **DeliveryReminderScheduler** class identifies delayed deliveries and sends reminder notifications to customers.

It checks deliveries that have passed their delivery date but have not yet been marked as Delivered.

The scheduler was configured for daily execution.

4.7 Lightning Web Components

Lightning Web Components were developed to provide an interactive user interface.

Restaurant Dashboard LWC

The Restaurant Dashboard displays:

- Today's Orders
- Daily Revenue

The component uses Apex to retrieve current order information and revenue.

Order Management LWC

The Order Management component provides:

- Place Order
- View Order Status

Users can create orders and monitor their status.

Delivery LWC

The Delivery component provides:

Innovation & Entrepreneurship Hub for Educated Rural Youth (SURE Trust – IERY)

- Assign Delivery Partner
- Track Delivery Status

This allows restaurant staff to manage delivery operations.

The screenshot shows the Salesforce 'Delivery Management' page. The 'Assign Delivery Partner' section includes a search bar for 'Order', a dropdown for 'Delivery Partner', and a date picker for 'Delivery Date' set to '07-Sept-2026'. A blue 'Assign Delivery' button is visible. Below this, the 'Track Delivery Status' section displays a table with delivery details:

Delivery ID	Order ID	Delivery Partner	Delivery Date	Delivery Status

4.9 Salesforce Dashboard

A **Restaurant Dashboard** was created to provide a high-level view of restaurant operations.

The dashboard contains six major components:

1. Total Orders

Provides an overview of restaurant order activity.

2. Total Customers

Provides information about the number of customers in the system.

3. Daily Revenue

Displays revenue information for the selected/current day.

4. Pending Orders

Displays orders that are currently in active statuses such as:

- Placed
- Preparing
- Ready

5. Completed Deliveries

Displays deliveries that have been successfully completed.

Innovation & Entrepreneurship Hub for Educated Rural Youth (SURE Trust – IERY)

6. Top Selling Menu Items

Provides menu-item-level information for management analysis.

The dashboard allows restaurant management to quickly understand the operational status of the restaurant without manually checking individual records.

Daily Revenue

Order Name	Customer: Full Name	Order Date	Order Type	Total Amount	Table: Table Name
ORD-00017	Sajid Salesforce	05/09/2026	Dine-In	₹2,507.00	Table number 6
ORD-00018	Rose Gonzalez	05/09/2026	Takeaway	₹5,969.00	Table number 7

Pending Orders

Order Status	Order Name	Customer: Full Name	Order Date	Order Type	Table: Table Name	Total Amount
Placed (7)	ORD-00002	Sajid Salesforce	11/08/2026	Takeaway	Table number 2	₹1,255.00
	ORD-00003	Sajid Salesforce	12/08/2026	Online	Table number 3	₹69.00

Innovation & Entrepreneurship Hub for Educated Rural Youth (SURE Trust – IERY)

4.10 Security Implementation

Security was configured to restrict access to business data.

The Organization-Wide Default sharing settings were configured as **Private** for the required objects.

The project includes the following roles:

- Admin
- Restaurant Manager
- Cashier
- Chef
- Delivery Executive

Profiles were configured for:

- System Administrator
- Restaurant Manager
- Cashier
- Chef
- Delivery User

This structure supports role-based access to restaurant operations.

4.11 Project Architecture

Innovation & Entrepreneurship Hub for Educated Rural Youth (SURE Trust – IERY)

The overall architecture of the system can be represented as:

Users

Lightning Web Components / Salesforce UI

Salesforce Flows + Apex

Salesforce Objects

- Account
- Contact
- Menu Item
- Order
- Table
- Payment
- Delivery
- Chef

Reports & Dashboards

The architecture combines the Salesforce presentation layer, automation/business logic layer, data layer, and analytics layer.

User Interface Layer

Lightning Web Components provide interactive screens for order, payment, delivery, and dashboard operations.

Business Logic Layer

Salesforce Flow and Apex implement business rules and automation.

Data Layer

Salesforce standard and custom objects store restaurant-related information.

Analytics Layer

Salesforce Reports and Dashboards provide business insights.

4.12 Testing and Results

The application was tested using different scenarios.

Test 1 – Create Order

A customer order was created successfully through the Order Management interface.

Result: Successful.

Test 2 – Automatic Order Status

After creating an order, the record-triggered Flow automatically set the Order Status to **Placed**.

Result: Successful.

Test 3 – Invalid Menu Item Price

An attempt to enter an invalid menu item price was prevented.

Result: Validation worked successfully.

Test 4 – Invalid Payment Amount

The system prevented payment amounts that were zero or negative.

Result: Validation worked successfully.

Test 5 – Future Order Date

The system prevented future Order Dates.

Result: Validation worked successfully.

Test 6 – Duplicate Active Order

An attempt to create another active order for a table with an existing active order was blocked.

Result: Duplicate prevention worked successfully.

Test 7 – Process Payment

A payment was created successfully using the Payment LWC.

Result: Successful.

Test 8 – Automatic Payment Status

The Payment Flow automatically changed the payment status to **Paid**.

Result: Successful.

Test 9 – Delivery Assignment

A delivery partner was assigned successfully through the Delivery LWC.

Result: Successful.

Test 10 – Delivery Completion

Innovation & Entrepreneurship Hub for Educated Rural Youth (SURE Trust – IERY)

When delivery status was changed to **Delivered**, the related order status was automatically updated to **Delivered**.

Result: Successful.

Test 11 – Daily Sales Batch

Batch Apex successfully processed today's orders and calculated daily restaurant sales.

Result: Successful.

Test 12 – Scheduled Apex

The scheduled Apex classes were successfully tested and scheduled for daily execution.

Result: Successful.

5. SOCIAL / INDUSTRY RELEVANCE OF THE PROJECT

The Restaurant Order Management System has practical relevance to the restaurant and hospitality industry.

Restaurants require accurate and timely information about orders, customers, payments, tables, and deliveries. A centralized cloud-based solution can reduce dependence on manual record keeping and improve operational visibility.

5.1 Industry Relevance

The project demonstrates the use of Salesforce technology for:

- Restaurant order management
- Customer management
- Payment management
- Delivery tracking
- Restaurant analytics
- Business process automation

The architecture can be adapted for restaurants of different sizes.

5.2 Reduction of Manual Work

Automated Flows reduce repetitive tasks.

Innovation & Entrepreneurship Hub for Educated Rural Youth (SURE Trust – IERY)

For example:

- Order status can be automatically set to Placed.
- Payment status can automatically become Paid.
- Delivered orders can automatically update their related Order status.
- Daily reports can be generated automatically.
- Delayed deliveries can trigger notifications.

5.3 Improved Data Accuracy

Validation Rules prevent incorrect information from entering the system.

This improves:

- Data consistency
- Payment accuracy
- Order accuracy
- Delivery tracking
- Table management

5.4 Better Decision Making

The Reports and Dashboard provide management with useful information about:

- Orders
- Customers
- Revenue
- Pending orders
- Deliveries
- Menu items

Managers can use this information to monitor restaurant performance and identify areas requiring attention.

5.5 Cloud-Based Accessibility

Since the application is developed on Salesforce, authorized users can access the system through the Salesforce platform rather than relying on a locally installed application.

Innovation & Entrepreneurship Hub for Educated Rural Youth (SURE Trust – IERY)

This makes the solution suitable for organizations that require centralized cloud-based management.

6 Learning and Reflection

The project provided significant practical experience in Salesforce development.

6.1 Technical Learning

During the project, I gained practical knowledge of:

- Salesforce Objects
- Custom Objects
- Standard Objects
- Custom Fields
- Lookup Relationships
- Picklists
- Validation Rules
- Record Types
- Salesforce Flow
- Record-Triggered Flow
- Screen Flow
- Scheduled Flow
- Apex
- Apex Triggers
- Batch Apex
- Schedulable Apex
- Lightning Web Components
- Salesforce Reports
- Salesforce Dashboards
- Salesforce Security

6.2 Salesforce Data Modeling

One of the important learnings was understanding how business entities can be represented using Salesforce objects.

Innovation & Entrepreneurship Hub for Educated Rural Youth (SURE Trust – IERY)

For example, restaurants, customers, orders, payments, deliveries, tables, chefs, and menu items were represented as related Salesforce records.

This helped in understanding how relationships between different business entities can be implemented using lookup relationships.

6.3 Learning Salesforce Flow

The project provided practical experience in using Salesforce Flow to automate business processes.

I learned how to:

- Create Screen Flows.
- Create Record-Triggered Flows.
- Create Scheduled Flows.
- Use Get Records.
- Use Decision elements.
- Use Assignment elements.
- Update records.
- Send emails.
- Test and debug Flows.

6.4 Learning Apex

The project improved my understanding of Apex programming.

I learned how to:

- Create Apex classes.
- Create Apex triggers.
- Query Salesforce records using SOQL.
- Process collections of records.
- Implement business logic.
- Use Batch Apex.
- Use Schedulable Apex.
- Send emails programmatically.

Innovation & Entrepreneurship Hub for Educated Rural Youth (SURE Trust – IERY)

6.5 Learning Lightning Web Components

Developing LWCs helped me understand how Salesforce can provide customized user interfaces.

I learned about:

- Component-based development.
- JavaScript.
- HTML templates.
- Apex integration.
- Salesforce record operations.
- Interactive user interfaces.

The project helped me understand the connection between the user interface, Salesforce data, Flow automation, and Apex logic.

6.6 Learning Reports and Dashboards

Creating Reports and Dashboards helped me understand how raw business data can be converted into useful management information.

I learned how to:

- Create reports.
- Configure report filters.
- Group report data.
- Summarize values.
- Create dashboard components.
- Present business information visually.

6.7 Overall Experience

Working on the project provided practical exposure to developing a complete cloud application rather than only working on individual programming concepts.

The project required understanding requirements, designing the data model, implementing automation, writing Apex, developing user interfaces, testing functionality, and presenting the final solution.

It also improved problem-solving skills because different Salesforce components had to work together correctly.

Innovation & Entrepreneurship Hub for Educated Rural Youth (SURE Trust – IERY)

7 Conclusion and Future Scope

7.1 Conclusion

The **Restaurant Order Management System** was successfully developed using Salesforce.

The project demonstrates how Salesforce can be customized to address restaurant business requirements through a combination of standard Salesforce functionality, custom development, automation, and analytics.

The implemented solution includes:

- Restaurant management
- Customer management
- Menu item management
- Order management
- Table management
- Payment management
- Delivery management
- Chef management
- Validation rules
- Record Types
- Salesforce Flows
- Apex Trigger
- Batch Apex
- Schedulable Apex
- Lightning Web Components
- Reports
- Dashboard
- Role-based security

The system successfully automates several restaurant processes and provides centralized access to operational information.

Innovation & Entrepreneurship Hub for Educated Rural Youth (SURE Trust – IERY)

The project also provided valuable practical experience in Salesforce development and demonstrated how cloud platforms can be used to create industry-oriented applications.

7.2 Future Scope

The system can be further enhanced with additional features.

1. Order Item Management

A future version can introduce a separate **Order Item** object to allow users to select individual menu items and quantities while placing an order.

For example:

Samosa × 2 = ₹40

Panipuri × 1 = ₹69

The system could then automatically calculate the total order amount.

2. Online Customer Ordering

The system could be extended to provide a customer-facing online ordering portal where customers can:

- Browse menus.
- Select items.
- Add items to a cart.
- Place orders.
- Make payments.
- Track deliveries.

3. Real-Time Delivery Tracking

Integration with mapping and delivery services could allow real-time tracking of delivery partners.

4. Online Payment Gateway

The system could be integrated with payment gateways to support secure online payments.

5. Advanced Analytics

Future dashboards could include:

Innovation & Entrepreneurship Hub for Educated Rural Youth (SURE Trust – IERY)

- Monthly revenue
- Weekly sales trends
- Most ordered food categories
- Customer spending trends
- Restaurant performance
- Delivery performance
- Peak ordering times

6. Mobile Application

A Salesforce-based mobile experience or dedicated mobile application could allow restaurant staff to manage orders, payments, tables, and deliveries from mobile devices.

7. AI-Based Recommendations

Artificial Intelligence could be integrated to recommend menu items based on customer ordering history and popular items.

8. Inventory Management

The system could be extended to track:

- Ingredients
- Stock levels
- Purchase records
- Low-stock alerts
- Ingredient consumption

This would provide a more complete restaurant management solution.

Innovation & Entrepreneurship Hub for Educated Rural Youth (SURE Trust – IERY)

FINAL PROJECT OUTCOME

The completed project demonstrates a complete Salesforce-based business application combining **data management, automation, programmatic development, user interface development, security, reporting, and analytics.**

The project successfully transformed the initial restaurant management requirements into a working cloud-based solution.

The experience gained through this project has strengthened practical knowledge of Salesforce and provided an understanding of how CRM platforms can be customized to solve real-world business problems.
